

Far West NSW Palliative and End of Life Model of Care

Medical Goals of Care

GOALS OF CARE	CURATIVE	STABLE Palliative Care Phase	UNSTABLE Palliative Care Phase	DETERIORATIVE Palliative Care Phase	TERMINAL Palliative Care Phase	BEREAVEMENT Palliative Care Phase
Definition of Palliative Care Phase		<ul style="list-style-type: none"> Problems and symptoms are adequately controlled by established plan of care Family and carer situation is relatively stable No new issues apparent 	<ul style="list-style-type: none"> Existing problems rapidly increase in severity New problems develop that were not anticipated in existing plan of care Family and carer circumstances change suddenly and impact on patient care 	<ul style="list-style-type: none"> Overall functional declining Gradual worsening of existing problems New, but anticipated, problems develop Family and carers experience gradual worsening distress which impacts patient care 	<ul style="list-style-type: none"> Death likely within days 	<ul style="list-style-type: none"> Patient has died Bereavement support provided to family & carers
Goals of care	Cure or prolonged remission, with restoration of health status and function with no limitations of care and treatment	Maintenance of symptom control, function and quality of life within context of life-limiting diagnosis; limitations of care and treatment likely	Treatment of potentially reversible cause of acute deterioration, as well as symptom control and functional support within context of life-limiting diagnosis; limitations of care and treatment likely	Symptom management and support of functional decline to sustain quality of life in context of life-limiting diagnosis and within limitations of expected deterioration	Comfort, dignified and compassionate care in the last days of life	After death bereavement support for family and carers
Clinical scenario	<ul style="list-style-type: none"> Reasonable chance of cure Reasonable expectation of complete recovery from acute medical problem 	<ul style="list-style-type: none"> Incurable life-limiting disease Prognostic Indicators? Surprise question – 6-12 months? Living, whilst anticipating death 	<ul style="list-style-type: none"> Incurable life-limiting disease Acute deterioration due to potentially reversible cause Recovery uncertain: may recover to stable phase or may transition to deteriorating/terminal phase 	<ul style="list-style-type: none"> Incurable life-limiting disease No sustained response to treatment Disease progression despite maximal therapy Gradual but steady decline in health Functional decline and increasing dependency Anticipating and preparing for death 	<ul style="list-style-type: none"> Incurable life-limiting disease No sustained response to treatment Disease progression despite maximal therapy Clinical indicators suggesting a diagnosis of dying Surprise question – this week? 	
Prognosis	<ul style="list-style-type: none"> Indefinite Normal life-expectancy with complete recovery 	Months, sometimes years	Uncertain	Weeks	Days or hours	
Key clinical process		Holistic Assessment & Advance Care Planning	AMBER Care Bundle	Care Coordination & MDT Case Conferencing	Last Days of Life Toolkit	
Investigation and monitoring	<ul style="list-style-type: none"> As indicated to assess clinical situation and determine appropriate management plan 	<ul style="list-style-type: none"> Routine medical, nursing and allied health not usually required May be clinically indicated to assess for potentially reversible acute deterioration May also be clinically indicated to guide symptom management or support quality of life Must be acceptable to the patient 	<ul style="list-style-type: none"> As clinically indicated to assess potentially reversible acute deterioration May also be clinically indicated to guide symptom management or support quality of life May have altered calling criteria, but must be in line with goals of care Must be acceptable to the patient 	<ul style="list-style-type: none"> Discontinue routine medical, nursing and allied health investigations and monitoring Should only be undertaken if clinically indicated to guide symptom management or to support quality of life May have altered calling criteria, but must be in line with goals of care Must be acceptable to the patient 	<ul style="list-style-type: none"> Discontinue all invasive medical, nursing and allied health interventions including observations, blood tests, pathology, radiology, etc. Only continue if contributing to comfort care 	
Active treatment of underlying disease	<ul style="list-style-type: none"> All active treatment given to cure disease and manage treatment-related adverse effects 	<ul style="list-style-type: none"> Palliative treatment of disease may be considered (for specific symptom control or to maintain quality of life) Active management of treatment-related adverse effects 	<ul style="list-style-type: none"> Palliative treatment of disease may be considered (as in stable phase) Active management of treatment-related adverse effects Active treatment of potentially reversible cause of acute deterioration 	<ul style="list-style-type: none"> Discontinue all disease-modifying palliative treatments Some medical therapies may be considered for symptom control or to support quality of life 	<ul style="list-style-type: none"> Disease-modifying palliative treatment of disease inappropriate, and should be discontinued Discontinue all active medical therapies Only continue treatments if contributing to comfort care 	
Acceptable level of adverse effects	<ul style="list-style-type: none"> High level of adverse effect are accepted Risk of treatment-related mortality may be accepted 	<ul style="list-style-type: none"> Some level of adverse effects may be acceptable All treatment-related adverse effects must be proportionate to goals of care and acceptable to the patient 	<ul style="list-style-type: none"> Some level of adverse effects may be acceptable All treatment-related adverse effects must be proportionate to goals of care and acceptable to the patient 	<ul style="list-style-type: none"> Only minimal treatment-related adverse effects are acceptable The symptomatic benefit of treatment must outweigh the burden of adverse effects and be acceptable to the patient 	<ul style="list-style-type: none"> No treatment-related toxicity is acceptable from any medical, nursing or allied health intervention 	
Life-sustaining treatment for other conditions	<ul style="list-style-type: none"> All given as needed and clinically indicated 	Usually continued, but consider rationalisation of non-essential treatments	Usually continued, but consider rationalisation of non-essential treatments	Discontinue, unless doing so would result in preventable unpleasant symptoms, reduced quality of life, or premature death unrelated to life-limiting diagnosis	Discontinue, unless doing so would result in preventable unpleasant symptoms	<ul style="list-style-type: none"> Implantable cardiac defibrillator (ICD) devices must be deactivated in the deteriorating or terminal palliative care phases *
Symptomatic management	<ul style="list-style-type: none"> Yes, alongside active management 	<ul style="list-style-type: none"> Yes Oral medications usually tolerated 	<ul style="list-style-type: none"> Yes, alongside acute management Oral medications usually tolerated If acute deterioration has compromised oral route, temporary alternative medication administration may need to be considered Consider provision of Palliative Care Crisis Medications if recovery uncertain 	<ul style="list-style-type: none"> Yes Oral medication usually tolerated Alternative route for medication administration may need to be considered as expected deterioration occurs Provision of Palliative Care Crisis Medications in anticipation of transition to terminal phase 	<ul style="list-style-type: none"> Yes Palliative Care Crisis Medications 	
Medical provision of hydration and nutrition	<ul style="list-style-type: none"> Yes, and given as needed and clinically indicated 	Given if clinically indicated and desired by the patient	Given if clinically indicated and desired by the patient	<ul style="list-style-type: none"> May be considered for symptom control or to support quality of life Even if at risk of aspiration, oral intake may be appropriate to support of quality of life desires 	<ul style="list-style-type: none"> Usually non-commenced or ceased Oral sips and feeding at patient's request Regular and effective mouthcare is essential 	
Acute resuscitation (including CPR)	<ul style="list-style-type: none"> All acute resuscitation given if clinically indicated (including CPR, defibrillation, intubation, Ventilation, ICU admission and/or transfer to high acuity facility) 	<ul style="list-style-type: none"> Not usually recommended Should not be required in stable phase As part of advance care planning conversations, may be discussed with patient if competent, and/or person responsible if not competent, in context of underlying life-limiting illness CPR, defibrillation, intubation and ventilation not usually recommended ICU admission or transfer to high acuity facility may be considered in unstable phase for treatment of potentially reversible cause of acute deterioration, but must be proportionate to goals of care and acceptable to the patient 	<ul style="list-style-type: none"> Not usually recommended CPR, defibrillation, intubation and ventilation not usually recommended ICU admission or transfer to high acuity facility may be considered for treatment of potentially reversible cause of acute deterioration, but must be proportionate to goals of care and acceptable to the patient Usually discussed with patient if competent, and/or person responsible if not competent, in context of life-limiting illness and advance care planning conversations 	<ul style="list-style-type: none"> Not clinically appropriate; should not be offered Discussion with patient and family should focus on progression of incurable and life-limiting illness, importance of symptom control and anticipation of death and dying Specific discussion regarding resuscitation may not be warranted, unless requested by patient or family 	<ul style="list-style-type: none"> Not clinically appropriate; should not be offered Discussion with patient, if able, and family should focus on dying, imminent death, and importance of comfort care Specific discussion regarding resuscitation is not usually warranted, unless patient or family wish
